

1 Telemetry

Telemetry is one of the “smart” features available on IntelliPack foam-in-place packaging systems.

IntelliPack’s cellular telemetry automatically collects, monitors and measures critical information, such as liquid foam and film usage, temperature, pressure and other system parameters each time the equipment is operated.

Your Pregis service technician will customize control boundaries for your foam-in-place system based on the frequency and equipment “use profile.” If a potential problem is detected, your foam-in-place system will alert a service technician. Through a proprietary tech service platform, called PX3, system parameters can be remotely adjusted to resolve an issue before it impacts performance. This feature minimizes costly downtime.

In other words, it’s like having a dedicated service technician on site, around the clock.

PERFORMANCE BENEFITS

- Increase productivity
- Optimize equipment performance
- Stay steps ahead of unexpected problems or costly downtime
- Simple connectivity
- Greater efficiency

The PX3 system also tracks consumption and performance metrics so the associated data is available to IntelliPack customers at any time to help in demand forecasting and inventory management.
